# **COVID-19 Morbidity and Mortality Data: Corrected and Adjusted Daily Time-Series for Wuhan, Hubei and Mainland China<sup>§</sup>**

**Lawrence J. Lau and Yanyan Xiong<sup>1</sup>**

June 2020

**Abstract:** In this Working Paper we discuss the procedure we used to adjust the cumulative and daily data on newly confirmed COVID-19 cases and new deaths resulting therefrom in Wuhan, Hubei ex Wuhan, and Mainland ex Hubei (excluding imported cases) to correct any perceived errors and inconsistencies, for example, a cumulative total number that decreases over time, and to smooth out the surges in the data that seem to be artificial, either because of possible delays in reporting or because of a change in the definition of a “confirmed” COVID-19 case in Hubei. Insofar as possible, we rely on the official cumulative total numbers of newly confirmed cases and new deaths as the controlled totals, because these numbers are updated daily whereas the past numbers of daily newly confirmed cases are seldom updated. However, sometimes the officially reported cumulative total numbers are inconsistent within themselves. When these situations arise, we examine the official data on the daily newly confirmed cases and new deaths to see whether the cumulative numbers can be minimally adjusted to become consistent.

The change in the definition of a “confirmed” case in Hubei on 2.12 not only affected the daily number of newly confirmed cases but also the daily number of new deaths as some deaths that occurred in the past were reclassified as deaths from COVID-19 cases. Similarly, the 325 newly confirmed cases and 1,290 new deaths reported in Wuhan on 4.16 must have been the results of delayed identification and could not have all occurred on that one day. The adjustment of data on the daily newly confirmed cases and new deaths essentially smooths the data and provides a more accurate picture of the progress of the COVID-19 epidemic. It is also more useful in terms of assessing and comparing the infection and mortality rates in and among Wuhan, Hubei ex Wuhan and Mainland ex Hubei.

Jamison, Ms. Ayesha Macpherson Lau, Dr. Kin Bing Wu and Prof. Chen Ning Yang for their helpful comments and suggestions on earlier drafts of parts of this paper. Responsibility for any errors remains with the authors. The opinions expressed herein are those of the authors and do not necessarily reflect the views of the Institute.

## **Introduction**

In this Working Paper we discuss the procedure we used to adjust the cumulative and daily data on newly confirmed COVID-19 cases and new deaths resulting therefrom in Wuhan, Hubei ex Wuhan, and Mainland ex Hubei (excluding imported cases) to correct any perceived errors and inconsistencies, for example, a cumulative total number that decreases over time, and to smooth out the surges in the data that seem to be artificial, either because of possible delays in reporting or because of a change in the definition of a “confirmed” COVID-19 case in Hubei. Insofar as possible, we rely on the official cumulative total numbers of newly confirmed cases and new deaths as the controlled totals, because these numbers are updated daily whereas the past numbers of daily newly confirmed cases are seldom updated. However, sometimes the officially reported cumulative total numbers are inconsistent within themselves. When these situations arise, we examine the official data on the daily newly confirmed cases and new deaths to see whether the cumulative numbers can be minimally adjusted to become consistent.

The change in the definition of a “confirmed” case in Hubei on 2.12 not only affected the daily number of newly confirmed cases but also the daily number of new deaths as some deaths that occurred in the past were reclassified as deaths from COVID-19 cases. Similarly, the 325 newly confirmed cases and 1,290 new deaths reported in Wuhan on 4.16 must have been the results of delayed identification and could not have all occurred on that one day. The adjustment of data on the daily newly confirmed cases and new deaths essentially smooths the data and provides a more accurate picture of the progress of the COVID-19 epidemic. It is also more useful in terms of assessing and comparing the infection and mortality rates in and among Wuhan, Hubei ex Wuhan and Mainland ex Hubei.

In Appendix 1 we discuss the procedures we used to revise the cumulative and daily data on newly confirmed cases and new deaths in Wuhan, Hubei ex Wuhan, and Mainland ex Hubei (excluding imported cases). The objective of the revision is to correct any perceived errors and inconsistencies, for example, a cumulative total number that decreases over time, and to smooth out the surges in the data that seem to be artificial, either because of possible delays in reporting or because of a change in the definition of a “confirmed” COVID-19 case in Hubei. Insofar as possible, we rely on the official cumulative numbers of newly confirmed cases and new deaths as the controlled totals, because these numbers are updated daily whereas

the past numbers of daily newly confirmed cases are seldom updated. However, sometimes the officially reported cumulative total numbers are inconsistent within themselves. When these situations arise, we examine the official data on the daily newly confirmed cases and new deaths to see whether the cumulative numbers can be minimally adjusted to become consistent. The change in the definition of a “confirmed” case in Hubei on 2.12 not only affected the daily number of newly confirmed cases but also the daily number of new deaths as some deaths that occurred in the past were reclassified as deaths from COVID-19 cases. Similarly, the 325 newly confirmed cases and 1,290 new deaths reported in Wuhan on 4.16 must have been the results of delayed identification and could not have all occurred on that one day. The adjustment of data on the daily newly confirmed cases and new deaths essentially smooths the data and provides a more accurate picture of the progress of the COVID-19 epidemic. It is also more useful in terms of assessing and comparing the infection and mortality rates in and among Wuhan, Hubei ex Wuhan and Mainland ex Hubei.

### **The Derivation and Adjustment of the Daily Newly Confirmed Cases**

#### **Wuhan**

The first confirmed COVID-19 case was reported in Wuhan on 1 December 2019.<sup>2</sup> In Table A1-1, column 2, the original official daily data on the cumulative number of newly confirmed cases in Wuhan from 1.10 to 5.31 are presented. The first check is whether these numbers are monotonically increasing over time. They are. In column 3, we derive the implied daily newly confirmed cases from the cumulative data. In column 4, the original official data on the daily newly confirmed cases are presented. In column 5, the derived numbers of newly confirmed cases in column 3 are compared with the official data in column 4. It turns out that the two sources of data differ only on three occasions: 2.09, 2.13 and 2.23 (numbers displayed in red). We shall adopt and use the implied numbers of daily newly confirmed cases in column 3, because otherwise the cumulative totals of the daily newly confirmed cases will fail to match the official data on the cumulative totals.

---

<sup>2</sup> The first case was identified as laboratory-confirmed COVID-19 infection in Wuhan on 1 December 2019. See Huang et al. (2020).

We also observe that there were three surges in the numbers of newly confirmed cases in Wuhan. The first surge in the data can be observed on 1.27 (displayed in red), when the number of daily newly confirmed cases jumped from 80 on 1.26 to 892 on 1.27 and then fell back to 315 on 1.28. It is thought that the number of newly confirmed cases could not possibly have increased that much in one day at the then early stage of the COVID-19 epidemic and that it must have been the result of delayed reporting over the previous days. Thus, we attempt to reallocate the estimated “excess” reported cases on 1.27 to the days between 1.16 and 1.27, holding constant the cumulative total number of confirmed cases through 1.27 at 1,590, the official number of cumulative confirmed cases as of that date.

The first step in the reallocation is to estimate the number of newly confirmed cases on 1.27 in the absence of the surge. By running a regression of the natural logarithm of the number of newly confirmed cases on a time trend, using data from 1.16 to 1.31, and predicting from the resulting estimated equation the “missing” value on 1.27, we obtain 251, after an adjustment of the constant term<sup>3</sup>. The resultant 641 (892-251) “excess” cases are then reallocated to the days between 1.16 and 1.27 proportionally. The adjusted numbers of daily newly confirmed cases are approximately 70.6% (641/908<sup>4</sup>) higher than before. They are presented in column 6, with the adjusted numbers in red.

The second surge in the data can be observed on 2.12, when the definition of a “confirmed” case in Hubei was changed to conform to the practice in the rest of the Mainland, that is, in the absence of results from a nucleic acid test, a combination of clinical symptoms is also sufficient to confirm a COVID-19 case. This change in definition led to a huge increase of newly confirmed cases of 13,436 on 2.12 (displayed in red). For this second surge, fortunately, for a couple of days during the transition in the definition, the numbers of newly confirmed cases under both the old and the new definitions were available. It was 1,072<sup>5</sup> on 2.12 according to the old definition. This provided the basis for us to reallocate the “excess”

---

<sup>3</sup> The constant term is adjusted so that the predicted value is exactly equal to the actual value on 1.28.

<sup>4</sup> 908 is the sum of the daily newly confirmed cases in column 3 from 1.16 to 1.26 plus the predicted 251 for 1.27.

<sup>5</sup> The Health Commission of Hubei Province released the cumulative confirmed cases of 32,994 according to the new definition on 2.12, and identified the number of confirmed cases due to the new definition to be 12,364 on 2.12. The number of cumulative confirmed cases on 2.12 in accordance with the old definition was therefore 20,630 (32,994-12,364). The number of cumulative confirmed cases released by the Health Commission of Hubei Province on 2.11 was 19,558. Therefore, the number of newly confirmed cases on 2.12 in accordance with the old definition was 1,072 (20,630-19,558).

newly confirmed cases of 12,364 (13,436-1,072) on 2.12 to the days between 1.16 and 2.12 on a proportional basis. The adjusted figures are presented in column 7, again in red. The adjusted numbers of daily newly confirmed cases are approximately 60.0% ( $12,364/20,589^6$ ) higher than before.

The third surge in the data can be observed on 4.16 (displayed in red), when the Health Commission of Wuhan announced the upward revision of the cumulative numbers of newly confirmed cases and deaths by 325 and 1,290 respectively<sup>7 8</sup>. These additional cases and deaths are reallocated to the days between 1.16 and 4.16 on a proportional basis. The adjusted numbers of daily newly confirmed cases are presented in column 8 in red. They are approximately 0.6% ( $325/49,966^9$ ) higher than before. They are our final adjusted numbers of daily newly confirmed cases in Wuhan. In column 9, the cumulative totals of these final adjusted numbers are presented. The totals in column 9 between 4.16 and 5.31 agree exactly with the totals of the original official cumulative newly confirmed cases (column 2).

---

<sup>6</sup> 20,589 is the sum of the daily newly confirmed cases in column 6 from 1.16 to 2.11 plus 1,072.

<sup>7</sup> One may question why the additional number of newly confirmed cases was less than the additional number of deaths. It turned out that 965 (1,290-325) of the newly reported deaths were COVID-19 patients who were thought to have been cured and hence discharged from hospitals but subsequently died at home.

<sup>8</sup> The upward revisions of cases and deaths are not unusual because of the high probabilities of under-counting. See Burn-Murdoch et al. (2020).

<sup>9</sup> 49,966 is the sum of the daily newly confirmed cases in column 7 from 1.16 to 4.15 plus 0 case on 4.16 before the surge.

Both the original official implied (column 3 of Table A1-1) and the final adjusted (column 8 of Table A1-1) data on the daily newly confirmed cases are presented in Chart A1-1. The original red line shows the three surges in the number of newly confirmed cases. The adjusted blue line no longer shows the surges. However, the areas under each of the lines are actually identical because they both represent the same cumulative total of daily newly confirmed cases.

### Hubei ex Wuhan

In Table A1-2, the original official data on the cumulative (column 2) and daily newly confirmed (column 4) cases in Hubei ex Wuhan are presented. The implied daily newly confirmed cases derived from column 2 are presented in column 3. The first check is whether the official cumulative numbers are monotonically increasing over time. Unfortunately, they are not. Specifically, it is found that the reported number of cumulative confirmed cases in Hubei ex Wuhan, which was 17,742 on 2.20, decreased to 17,680 on 2.23 and ended with 17,715 on 2.24 (displayed in red). As a decrease in a cumulative total number over time is impossible, the figures between 2.20 and 2.22 must have errors. (This inconsistency is also revealed by the negative implied daily newly confirmed cases of -203 on 2.23.) We compare

the implied numbers of newly confirmed cases (column 3) with the official data on newly confirmed cases (column 4) in column 5. While there are differences, they are the same between 2.19 and 2.22, and on or after 2.24. We first note that both the implied and the direct numbers of newly confirmed cases on 2.24 are 35. If we subtract 35 from 17,715, the cumulative number on 2.24, we obtain 17,680, exactly the same as the cumulative number on 2.23. By successively subtracting the numbers of newly confirmed cases on 2.23 (50), 2.22 (89) and 2.21 (52) from 17,680, we obtain the corrected cumulative numbers of 17,630, 17,541, and 17,489 for 2.22, 2.21, and 2.20, respectively (displayed in red). With these corrections, the inconsistencies due to non-monotonicity are removed. The corrected series of cumulative new cases are presented in column 6, with the implied newly confirmed cases presented in column 7.

Having corrected for the inconsistencies in the cumulative data, we proceed to adjust the newly confirmed cases for the surge in the number of newly confirmed cases in Hubei ex Wuhan on 2.12. Fortunately, the additional numbers of newly confirmed cases due to the change in definition in both Hubei and Wuhan are known, respectively 13,332<sup>10</sup> and 12,364. Thus, the additional number of cases due to the change in definition in Hubei ex Wuhan on 2.12 may be estimated to be 968 (13,332-12,364), and the number of newly confirmed cases under the old definition may be estimated as 436, the difference between 1,404, the total number of newly confirmed cases, and 968. Next, we reallocate the “excess” newly confirmed cases of 968 on 2.12 to the days between 1.10 and 2.12 on a proportional basis.<sup>11</sup> The adjusted figures are presented in column 8 in red. The adjusted numbers of daily newly confirmed cases are approximately 6.8% ( $968/14,244^{12}$ ) higher than before. They are our final adjusted numbers of daily newly confirmed cases in Hubei ex Wuhan. In column 9, the cumulative total numbers of our final adjusted series of newly confirmed cases are presented. The cumulative total numbers of confirmed cases in column 9 on and after 2.23 are identical with the original official data on cumulative confirmed cases (column 2) as there was no revision in the data for Hubei ex Wuhan on 4.16.

---

<sup>10</sup> The Health Commission of Hubei Province released the number of additional confirmed cases for Hubei due to the new definition as 13,332 on 2.12.

<sup>11</sup> All confirmed COVID-19 cases in the Mainland of China came from Wuhan before 1.20.

<sup>12</sup> 14,244 is the sum of the daily newly confirmed cases in column 7 from 1.20 to 2.11 plus 436.

The implied (corrected for inconsistencies) (column 7 of Table A1-2) and the final adjusted (column 8 of Table A1-2) data on the daily newly confirmed cases are also presented in Chart A1-2. The adjusted blue line no longer shows the huge surge on 2.12 of the red line. However, the areas under each of the lines are actually identical because they both represent the same cumulative total number of daily newly confirmed cases.

**Chart A1-2: Hubei ex Imported and Wuhan:  
Implied and Adjusted Daily Newly Confirmed Cases**

## **Hubei**

In Table A1-3, the original official data on the cumulative daily newly confirmed cases in the Province of Hubei as a whole are presented in column 2. They are compared with the adjusted data for Hubei (column 5), which consist of the sum of the adjusted data for Wuhan (column 3) and Hubei ex Wuhan (column 4), which are taken from columns 9 of Tables A1-1 and A1-2 respectively. Columns 6 and 7, the implied daily newly confirmed cases, are derived from column 2 and column 5 respectively.

We note, first of all, that the adjusted cumulative total number of confirmed cases for Hubei is identical with the official cumulative number of confirmed cases on and after 4.16, as 4.16 was the last date with a surge. Second, the implied daily newly confirmed cases derived from the adjusted cumulative data are almost always larger than the implied cases derived from the official cumulative data (see column 8), except for the dates marked in red, when surges in the number of daily newly confirmed cases occurred<sup>13</sup>. This is because part of our adjustments consists of smoothing out the surges, that is, reallocating the sudden increases in the reporting of confirmed cases to the days past proportionally.

---

<sup>13</sup> There was no apparent surge in newly confirmed cases on 2.20. We believe the -251 was an error which was later rectified on 2.23.

Both the implied derived from official data numbers (column 6 of Table A1-3) and the final adjusted numbers (column 7 of Table A1-3) on the daily newly confirmed cases are presented in Chart A1-3. The adjusted blue line no longer shows the surges of the red line. The areas under both the red and the blue lines are actually identical because they both represent the same cumulative total of daily newly confirmed cases.

## Mainland ex Hubei

In Table A1-4 the original official data on the cumulative confirmed cases on the entire Mainland (column 2), Hubei (column 3), and Mainland ex Hubei (column 4) are presented (all ex imported). We first verify that the cumulative confirmed cases data for Mainland ex Hubei satisfy the monotonicity requirement over time. They do. Since there has been no change in the definition of a “confirmed” case used outside of Hubei, nor any one-off adjustment of the data, no further adjustment of the Mainland ex Hubei data is necessary. In column 5, the numbers of implied daily newly confirmed cases for Mainland ex Hubei are derived from column 4. They are compared with the number of direct official daily newly confirmed cases (column 6) in column 7. As column 7 indicates, there are minor discrepancies between the implied daily newly confirmed cases and the direct daily newly confirmed cases. However, the differences between them are not large, especially after 2.11. But both sets of numbers show an identical unexplained surge of 258 cases on 2.20. In order to maintain consistency with the official cumulative cases data, we shall use the implied daily newly confirmed cases in column 5 as the final adjusted daily newly confirmed cases. The implied (blue line) and the original direct official (red line) series of daily newly confirmed cases are compared in Chart A1-4.

**Chart A1-4: Mainland ex Imported and Hubei:  
Direct and Implied Daily Newly Confirmed Cases**

### The Mainland as a Whole

In Table A1-5, the original official data on the cumulative daily newly confirmed cases on the entire Mainland (except imported cases) are presented in column 2. There appear to be surges in the number of daily newly confirmed cases similar to those in Wuhan and Hubei on 1.27, 2.12 and 4.16. In columns 3 and 4, we present our final cumulative daily newly confirmed cases for Hubei (from column 5 of Table A1-3) and Mainland ex Hubei (from column 4 of Table A1-4) respectively. By adding together columns 3 and 4, we obtain the adjusted cumulative daily newly confirmed cases for the Mainland as a whole (column 5). The implied numbers of daily newly confirmed cases from the original official cumulative data and from the final adjusted cumulative data are presented in columns 6 and 7 respectively. They are compared in column 8. The adjusted series of daily newly confirmed cases are almost always larger than the original series because of the reallocation of the “excess” cases attributed to the surges. Again, the official and the adjusted series fully coincide after 4.16. Both the original (column 6, red line) and the finally adjusted (column 7, blue line) data are compared in Chart A1-5. The adjusted blue line no longer shows the surges.

**Chart A1-5: Mainland ex Imported: Implied and Adjusted Daily Newly Confirmed Cases**

## The Adjustment of the Daily New Deaths

### Wuhan

The first death from COVID-19 was reported in Wuhan on 10 January 2020. In Table A1-6, column 2, the original official data on the cumulative number of new deaths in Wuhan are presented. The first check is whether these numbers are monotonically increasing over time. Unfortunately, they are not. The cumulative number was 1,036 on 2.12 and 1,016 on 2.13. Obviously, 1,036 must be an error. In column 3, we derive the implied numbers of daily new deaths from the cumulative data. In column 4, the original official data on the daily new deaths in Wuhan are presented. In column 5, the derived new deaths in column 3 are compared with the official data in column 4. It turns out that the data differ only on 2.13. The officially reported new deaths on 2.13 was 88. If 88 were adopted as the number of new deaths on 2.13, then subtracting it from 1,016 gives 928 as an estimated number of the cumulative deaths as of 2.12, which is used to replace 1,036, making the series of cumulative deaths monotonicity consistent. The corrected series is presented in column 6, and the numbers of daily newly confirmed cases derived therefrom in column 7, with 108 deaths on 2.12.

Even though there was a surge in the data on newly confirmed cases on 1.27, no similar surge was observed in the number of daily new deaths. There was a reported surge in new deaths of 216 on 2.12, when the definition of a “confirmed” case in Hubei was changed to conform to the practice in the rest of the Mainland. However, the 216 figure turned out to be an error and was replaced by 108. But even the 108 deaths on 2.12 could be from two separate sources, the deaths under the old definition, reported to be 82<sup>14</sup>, and the additional deaths under the new definition, given by 26 (108-82). This provided the basis for us to reallocate the 26 “excess” new deaths on 2.12 to the days between 1.10 and 2.12 on a proportional basis. The adjusted numbers of new deaths are presented in column 8. They are approximately 2.9% (26/902<sup>15</sup>) higher than before.

---

<sup>14</sup> The Health Commission of Hubei released the total number of new deaths of 216 according to the new definition on 2.12, and identified the number of new deaths due to the new definition to be 134 on 2.12. The number of new deaths on 2.12 in accordance with the old definition was therefore 82 (216-134).

<sup>15</sup> 902 is the sum of the daily new deaths in column 7 from 1.10 to 2.11 plus the 82 deaths on 2.12.

Finally, we need to reallocate the 1,290 additional deaths announced on 4.16 to the days from 1.10 to 4.16. This is done proportionally. The adjusted numbers of new deaths are presented in column 9. They are approximately 50.0% ( $1,290/2,579^{16}$ ) higher than before. In column 10, the daily numbers of cumulative deaths of the final adjusted series are presented and they agree exactly with the original official cumulative data in column 2 between 4.16 and 5.31.

---

<sup>16</sup> 2,579 is the sum of the daily new deaths in column 8 from 1.10 to 4.15 plus 0 death on 4.16 before the surge.

In Chart A1-6, both the original implied official (corrected for inconsistencies, column 7, red line) and the final adjusted (column 9, blue line) data on new deaths in Wuhan are presented and compared. The areas under the two curves are the same, as they should be, since the cumulative total of the adjusted series must be the same as the cumulative total of the consistency-corrected original series.

## **Hubei ex Wuhan**

In Table A1-7, the original official data on the cumulative deaths (column 2) and daily new deaths (column 4) in Hubei ex Wuhan are presented. The implied daily new deaths from the cumulative data are presented in column 3. Columns 3 and 4 are compared in column 5. They are actually the same on every date except for 2.13 when the difference is 23 and 2.14 when the difference is -23. We believe that this was simply a date-entry error. In addition, the daily new death data, which give 28 and 32 for 2.13 and 2.14 respectively seem much more reasonable. We therefore adopt the latter, resulting in a number of 302 for cumulative deaths on 2.13. There does not seem to be a surge on 2.12 despite the change in the definition of a confirmed case in Hubei. And there was no upward adjustment in either cases or deaths on 4.16. The implied daily new deaths corrected for inconsistencies in Hubei ex Wuhan are presented in column 7. The cumulative total numbers of deaths after 2.13 are identical for both the original official data (column 2) and the corrected data (column 8).

In Chart A1-7, the original implied daily new deaths for Hubei ex Wuhan (red line) are compared with the implied daily new deaths (blue line) with the inconsistencies corrected. We note that the areas under the curve are the same for both lines, reflecting the fact that the cumulative total number of deaths remains the same before and after the adjustments.

**Chart A1-7: Hubei ex Imported and Wuhan:  
Original and Corrected Implied Daily New Deaths**

## Hubei

In Table A1-8, the original official data on the cumulative new deaths in the Province of Hubei as a whole are presented in column 2. The implied daily new deaths are presented in column 3 and they are compared with the adjusted data for Hubei, which consist of the sum of the adjusted data for Wuhan (column 4) and Hubei ex Wuhan (column 5), given in column 6. The adjusted series are larger than the original series because they reflect the effects of reallocation of the surges in new deaths on 2.12 and 4.16. Of course, the official and the adjusted data fully coincide after 4.16.

In Chart A1-8, the original implied daily new deaths for Hubei (red line) are compared with the adjusted daily new deaths (blue line) which has the inconsistencies corrected and the surges smoothed. We note that the areas under the curve are the same for both lines, reflecting the fact that the cumulative total number of deaths in Hubei remains the same before and after the adjustments.

**Chart A1-8: Hubei ex Imported: Implied and Adjusted Daily New Deaths**

## Mainland ex Hubei

In Table A1-9, the original official data on the cumulative deaths on the Mainland and in Hubei are presented in columns 2 and 3 respectively. In column 4, the original official data on the cumulative number of deaths in Mainland ex Hubei are calculated as the difference between columns 2 and 3. The first check is whether these cumulative numbers in column 4 are monotonically increasing over time. They are not. The cumulative number was 57 on 2.12 and 39 on 2.13. Obviously, either 57 or 39 or both must be errors. In column 5, we derive the implied number of daily new deaths from the cumulative data. In column 6, the original official data on the daily new deaths in Mainland ex Hubei are presented. Columns 5 and 6 agree completely except on 2.13 and 2.14. However, if we adopt the official number of daily new deaths on 2.13 of 5, the cumulative number on 2.13 becomes 62, and if we add the official number of daily new deaths on 2.14 of 4 on 2.14, we obtain 66, precisely the same as the cumulative number of deaths on 2.14 in column 4. We conclude that this must be the appropriate correction of the inconsistency in the original official cumulative data. As there has been no change in the definition of a “confirmed” case outside of Hubei, and there were no upward adjustments of either confirmed cases or deaths, no further adjustment is necessary. Once the consistency correction is made, the implied series of new deaths in Mainland ex Hubei (column 8) turn out to be exactly the same as the original official data on daily new deaths (column 6). Since the two series are identical, so are their cumulative totals. In addition, the two lines will be identical. Thus, only one line, the blue line, will be presented in Chart A1-9.

**Chart A1-9: Mainland ex Imported and Hubei: Corrected Implied Daily New Deaths**

### The Mainland as a Whole

In Table A1-10, the original official data on the cumulative deaths on the entire Mainland are presented (column 2). There were similar surges in the number of daily new deaths on 2.12 and 4.16. The implied daily new deaths (column 3) are compared with the adjusted data for the Mainland (column 6), which consist of the sum of the adjusted data for Mainland ex Hubei and Hubei. The adjusted data are always greater than the implied data except for the surge dates of 2.12 and 4.16 because of the reallocation of the surges. Of course, the official and the adjusted cumulative data fully coincide after 4.16.

In Chart A1-10, the original implied daily new deaths for the Mainland as a whole (red line) are compared with the adjusted daily new deaths (blue line) which have the inconsistencies corrected and the surges smoothed. We note that the areas under the curve are the same for both lines, reflecting the fact that the cumulative total number of deaths remains the same before and after the adjustments.
